(54) **INFORMATION PROCESSING METHOD, INFORMATION PROCESSOR, AND STORAGE MEDIUM IN WHICH PROGRAM TO CONTROL SERVER IS STORED**

(57) Abstract:

PROBLEM TO BE SOLVED: To generate a mobile agent by a server at a remote place without introducing special software to the terminal side, and to receive a processing result of the mobile agent by electronic mail.

SOLUTION: The electronic mail is transmitted from terminals 211, 213 to the server 300. A mail keyword including agent specification information to specify an agent to be generated on the server and template change information to control processing contents of the agent are described in the electronic mail. The electronic mail is received and a specified agent generation template 347 is updated based on the mail keyword described in the received electronic mail by the server 300. And, the agent is generated and executed based on the updated template 347. The processing result obtained by execution of the agent is converted into a form of the electronic main and transmitted to a client or other specified receivers.
